

and we have hot water piped into our homes 24 hours a day included so I will be OK.

“I don’t like Putin’s war. The prices have gone up and we are affected, but I should manage to pay my bills this winter.”

Life is carrying on as normal, nightclubs are bursting, bars are full and river boats are crammed with revellers.

LOST SAVINGS

But Russians are receiving their news through state TV which says Ukraine is awash with Nazis and that Britain is actively arming Ukraine.

Professor Clarke added: “People in Russia are not getting the full story of the war, that’s for sure.

“People are beginning to pick up on the idea that they are not being given the full truth though. If you watch their TV they have crazy pundits on.

“They believe the war is driven by Britain, we are behind it and they want to bomb us.”

However, there a few small signs that sanctions are finally hitting.

A survey this week found that 80 per cent of Russians have lost savings since Putin went to war.

One in five reported losing almost all their savings, and eight per cent had completely lost their financial cushion.

Some Western goods have completely disappeared. Oligarchs can no longer buy luxury cars such as Rolls-Royce or Bentley.

A MacBook Pro 16in that cost £2,235 on the day war broke out is now £4,579 and Scottish whisky has tripled in price and is much harder to get.

Maria Kiselova, 33, a teacher from Siberia, says she has noticed price increases on medication.

Counting her roubles carefully, she said: “Sanitary towels have risen 55 per cent since the start of the year.

“For me the biggest headache, literally, is I can’t buy Nurofen, it just isn’t available. Beer is also up nine per cent.”

Opposite the Kremlin, designer brands Boss, Bulgari, Dior and Hermes have stopped trading. But many don’t care.

Miss Moscow Anna Yankova, 24, said: “Of course, it’s a pity some companies left, but Russian designers quickly occupied their niches.”

Meanwhile Sofia, 39, the wife of a millionaire and fanatical Putin supporter, has found ways to buy the designer clothes she loves from the UK.

She said: “Boris Johnson took us for fools. We’re rich enough to get our clothes and perfumes from other countries, even the ones that supposedly ‘ban’ Russians in the shops.

“I’m now awaiting my new outfits in a consignment routed through Kazakhstan that my friend bought for me in London.”

BREAKING: Did The NIH Just Admit Ivermectin Treats COVID?

by Volve, sep 1 2022, [LINK](#)

After spending the last 2 years mocking President Trump for promoting Ivermectin (you know, the “horse medicine”) the NIH (National Institutes of Health) has now quietly added it to their approved treatment list.

On the NIH’s official site under the Covid-19 treatment guidelines Ivermectin along with several other antiviral medicines were reportedly listed as treatment methods to Covid-19.

According to the site itself it says Ivermectin “is an antiparasitic drug that is being evaluated to treat COVID-19”.

Just six months ago major political voices were banned and even ridiculed for ever talking about Ivermectin as a treatment method against COVI and now the NIH is even promoting it.

So much for “trusting” the experts!

I have been right, from day one, about everything!

The crooked NIH has now added Ivermectin to their treatment list. Yes, they added the “horse dewormer”. SMH they were kicking people off social media for talking about...<https://t.co/IXcGzVJBqM>

– Josh Barnett for Congress (AZ-01) (@BarnettforAZ) August 31, 2022

NIH CDC put adverts making it seem like Ivermectin was dangerous and for horses and people taking it are fools

How then do they do a 360 and list it as part of Covid treatment. If this does not wake you up nothing will

But then again Zombies have short memory #Ivermectin #BTC

– #ZedZed (@Zed_Blockchain) August 31, 2022

Here’s the NIH giving details about how Ivermectin works:

Ports from in vitro studies suggest that ivermectin acts by inhibiting host importin alpha/beta nuclear transport proteins, which

are part of a key intracellular transport process. Viruses hijack the process and enhance infection by suppressing the host’s antiviral response. In addition, ivermectin docking may interfere with SARS-CoV-2 spike protein attachment to the human cell membrane.

Some studies of ivermectin have also reported potential anti-inflammatory properties, which have been postulated to be beneficial in people with COVID-19.

Ivermectin has been shown to inhibit replication of SARS-CoV-2 in cell cultures. However, pharmacokinetic and pharmacodynamic studies suggest that achieving the plasma concentrations necessary for the antiviral efficacy detected in vitro would require administration of doses up to 100-fold higher than those approved for use in humans.

Although ivermectin appears to accumulate in lung tissue, predicted systemic plasma and lung tissue concentrations are much lower than 2 µM, the half-maximal inhibitory concentration (IC50) observed in vitro for ivermectin against SARS-CoV-2. Subcutaneous administration of ivermectin 400 µg/kg had no effect on SARS-CoV-2 viral loads in hamsters.

Suddenly Ivermectin shows up on the NIH website for treating Covid. After years of denial, blocking, interference, villification, ruining social media accounts, killing people, etc. they silently add it to their antiviral protocol. <pic.twitter.com/iSDwYLIU10>

– Dusty Desert Dweller (@dusty_dweller) August 31, 2022

When my daughter got Covid we used ivermectin with other prophylactics like Ambrosia Vida.

Covid gone in 8 hours.

Correlation of course, BUT why not use it? <https://t.co/8PE4WFYIB>

– Marc Lobliner – IFBB Pro (@MarcLobliner) August 31, 2022

It appears “conspiracy theorist” were right after all...
