

Late sequelae of covid-19 syringes, hand sanitizer, masks and test swabs that nobody talks about

by Berith Zenia Fagergaard, Naturopath, Dietician and Phytotherapist (Herbalist)

From time to time, we hear about late sequelae of covid-19, while Late sequelae of injections from the experimental covid-19 syringes, and excessive use of hand sanitizer, masks and test swabs are ignored.

More than 1000 possible late sequelae have been registered and may deaths after use of the different Covid-19 vaccinations. For instance, there has been an increase of up to 500% of heart infection among the young in 2021 and 2022.

Hand sanitizer destroys the natural defenses of the skin. Masks do not protect against virus and can induce anxiety and breathing problems. Test swabs can produce adverse affects such as nosebleed, aches, earache, dehydration, and ulcerations in mucous membranes that may affect smell etc.

Could these massive attacks on the immune system of the body in fact present a worse picture of the covid-19 symptoms than really justified?

The government forecasts a new epidemic wave this autumn, and huge sums of tax money are being invested in new experimental syringes.

Restrictions involving distance, isolation, tests, masks, and hand sanitizer are said to become re-introduced.

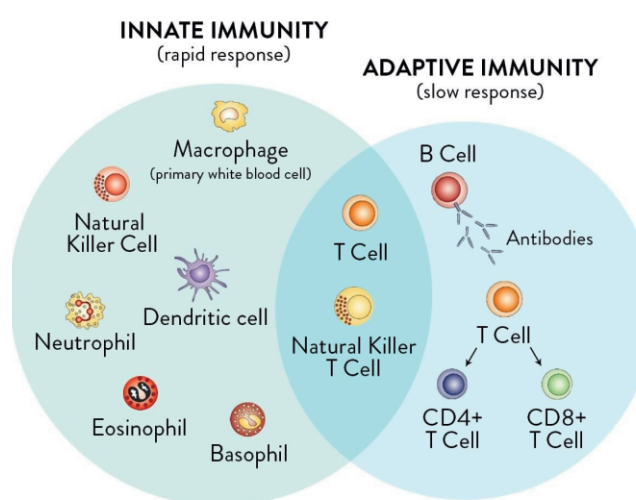

It is being postulated that herd immunity will be affected by vaccination, even though data has proved that the covid-19 syringes weaken the immune system and make people sicker than ever before. Side effects have been demonstrated on thousands of people, and excess mortality is on the rise while the birth rate is decreasing. Other countries show the same picture, while the media remain silent.

The many different restrictions attack our immune system and contribute to its weakening

To understand our immune system, it is necessary to understand its functioning. It consists of 2 parts: the unspecific and the specific immune system, each with their separate functions but in close cooperation.

The fact that has been overlooked regarding hand sanitizer, swabs, and masks is that they attack the defense of our skin and mucous membranes that interact with the other defense system, and this debilitates the body. I have written this article to make you know more about your own body and so become better able to take care of it.

The term "immunology" derives from the Latin word "immunis", meaning "free from"

As far back as 430 B.C. we have information about people who survived and didn't become sick while nursing plague patients. This has been found to be due to herd immunity, where the body's immune system has adapted to resist the disease, balancing the unspecific and specific immune system, the "inner and the outer army".

The immune system is developed by the interaction between the inner and the outer army

The outer army (the unspecific defense) is the first physical contact and barrier/border against the outside, as in the skin or the intestinal wall. It

involves skin, hair, sweat, mucous membranes, tears, and enzymes in the stomach and intestinal canal. Undesirable guest immediately activates this defense, which then sends little energetic soldiers out to attack and devour the unwelcome intruders. The defenders pass on information to the inner army (the specific defense), which thus becomes able to recognize them and annihilate them faster, should they send new troops later.

The immune system does not only attack, which is the function of the specific defense

Every time the defense has been attacked from the outside, information is collected and used to train the troops, so they are ready to launch a

counterattack, and also to be called back when the mission has been accomplished.

This troop development is of great importance for a robust and functioning immune system.

An overactive immune system can induce autoimmune sickness

An immature, overactive immune system may result in unfortunate attacks on the body itself, resulting in autoimmune illness.

Such "mis-coding" can occur if the body is overworked for extended periods, e.g. by stress, lack of sleep, medicine, anxiety, sugar, artificial

sweeteners and additives, pesticides used in conventional farming, food that has been highly processed, depleted, pasteurized at high temperature, homogenized, sterilized, treated for keeping qualities, junk food, GMO, cheap stale oil and margarine, radiation, heavy metals, etc.

But vaccines, too, have been in the searchlight for years by researchers, doctors, and other therapists, and there is base for serious concern for the use of the covid-19 vaccinations, which have not been thoroughly tested.

What about the experimental covid-19 syringes? Does it cause autoimmunity?

The late sequelae of this are not known since they
