

the plants resistant to the controversial poison glyphosate, which is an ingredient in the pesticide Roundup.

GMO interferes with the natural order. With "surgical precision" it cuts out one gene from the genome of one organism and introduces it into the integral genome of another. In this manner the life processes of the plant is slanted in a certain direction, and this is done with no consideration for the unknown consequences the modified crops will have on its immediate and surrounding environment.

The seeds are not bred naturally but produced in a laboratory. GMO crops, which are a catastrophic assault on nature, are produced as a technological miracle by the UN climate panel, which paradoxically justifies this form of intervention on nature with the justification of the genetically modified plants as part of the solution to the climate fraud.

Roundup contains glyphosate, suspected of causing cancer, continues to be approved by authorities

Previous tests on rats that were fed food containing various pesticides together with Roundup over a 2-year period, showed that several of the animals suffered severe liver and kidney damage.

Hormonal disturbances were found in the animals fed Roundup-sprayed corn and various organ damage in rats given Roundup in their drinking water. Cases of large cancerous tumors were also found.

The resistance that GMOs cause with the agent Roundup has already created problems in nature among wild plants and insect life. It is now affecting major crops in the United States and has become a veritable scourge that has spread and caused massive environmental problems.

Although there is a lot of evidence that confirms health damage, it is still used in countries around the world, either as crops or as animal feed.

Among other things, studies have shown that this toxin can damage the bees' digestive system, simply by causing the intestinal system to explode and that they - die. This is tragic for the environment, as bees play an important role in the ecosystem.

Bees provide pollination so that the plants can carry on their species.

Despite suspicions of serious harmful effects, the toxin glyphosate in Roundup is acquitted

The Danish Environmental Protection Agency and the European environmental authorities do not consider glyphosate to be harmful to animals or humans. The announcement from IARC, the international agency for cancer under the WHO, is different. Here, glyphosate is assessed as 'probably carcinogenic' to humans.

Pesticides cause endocrine disruption

Both the sperm quality in men and the hormonal balance of women are challenged by the many

toxins in nature.

It has been established how these substances were probably able to change into female estrogens. In nature called xenoestrogens.

Males in both animals and humans can develop into hermaphrodites.

It turned out i.e., in that alligators and turtles in a lake in Florida were dying out because the male genitalia were deformed due to the use of pesticides. When the researchers investigated why, it turned out that male crocodiles were developing ovaries and their penises were deformed.

The climate fraud, a lucrative business between state and industry, sells the lie to the citizens

The climate deception is a huge diversionary maneuver and a sales item, away from the real environmental problems we as a world community are facing today.

There is no clear evidence that the climate was man-made. Yet the governments accuse the people of the world of being complicit in the creation of CO₂.

Therefore, high taxes are imposed on the citizens, according to the motto that we must not own anything, according to the WEF. Agenda 2030.

Paradoxically, they will not remove the toxins completely, even though they are the real culprit. Authorities continue to approve poisons, fertilizers, pesticides, chemicals, radiation, medicines, heavy metals that contaminate and seep into our groundwater, into our oceans, lakes, streams, on the ground and in the air.

The food industry markets unhealthy foods that continue to be sold to citizens.

The pharmaceutical industry is absolved of responsibility

The pharmaceutical industry makes a fortune with money on medicines/vaccines and experimental Covid19 syringes that can cause harm, without

having to be held accountable and without consequences.

Their earnings are staggeringly high, so they can easily pay off the fines and still be able to afford to run a business.

Agreements are often concluded between the pharmaceutical industry, educational and treatment facilities as well as the state and authorities.

People are forced into forms of treatment, and cannot have a say in the course of treatment, unless they are self-paying. Insurance companies enter into special internal agreements with the pharmaceutical industry which are acquitted in compensation cases and are not made liable for compensation, even if they have caused personal injuries.

The thalidomide case

Back in the 1950s, pregnant women were offered the medicine Thalidomide for nausea.

The birth defects appeared as missing or severely deformed limbs and sometimes also as damage to the eyes, ears, and internal organs. The most frequently affected were mothers who had consumed the preparation a few times during the first months of pregnancy.

With long-term use of thalidomide, miscarriages or stillbirths were seen.

The arms industry is a major environmental problem

The arms industry, which receives state subsidies from governments around the world, to carry out war, pollutes nature, animals, and plants, which can make the area totally uninhabitable for many years to come. It is mentioned here because it is also a huge environmental problem.

Fluoride the pure poison

The then Danish dentist Henrik Lichtenberg wrote a sensational article about fluoride in the 1990s, "*The use of fluoride in dentistry*", which is worth reading. In this he describes how fluorine appears as a by-product in the form of sodium fluoride.

When in the 1940s and 1950s aluminum production was started for the aircraft industry, a waste product, sodium fluoride, emerged that was extremely toxic and difficult to break down in nature.

With the help of lobbying and lots of money for
